Abstract

Institutions play a key role in building entrepreneurial ecosystems (EEs). However, the academic literature does not well represent the historical roots of these institutions and most works are devoted to developed countries. This article examines the institutional conditions for the development of scientific and entrepreneurial activities at universities in the context of the transition to a market economy. It considers the «path dependence» (mentality and infrastructure inherited from the past), as well as specific mechanisms for regulating the interaction of universities and other subjects of EE developed during the transition period. Such an approach allows us to assess the potential of universities for the development of entrepreneurship in countries with a transition economy and the impact of historical development paths upon the current structural conditions and the specific features of the EE.

Keywords: entrepreneurial ecosystems; transition; entrepreneurship; universities; institutions

Although the concept is not new, there is still a growing amount of literature on entrepreneurial ecosystems [Cavallo et al., 2018; Ghio et al., 2019; Roundy, 2017; Roundy, Fayard, 2019]. The theoretical foundation of the entrepreneurial ecosystem (EE) concept is grounded in the literature on regional innovation systems, academic spin-offs, the triple helix model, and also in the literature on the interplay between institutional context and entrepreneurship. However, the theoretical richness of most of the literature is “tuned” to established Western market economies. Thus, to become relevant for transitional economies, it should be ‘reframed’ in the context of the dominant institutional environments that are to a significant extent predetermined by the former development and partially by the institutional traps of the transition itself in these countries. There are, however, only some exceptional attempts in the literature to explore the entrepreneurial ecosystems of some Central and Eastern European (CEE) economies and the Community of Independent States (CIS).

In general, the transition economies provide a picture of the huge differences in the quality of higher education and the development of market and democratic institutions, which might play an important role in the contemporary structure and embeddedness of the EE in these societies. The socialist mental and infrastructural legacy should be still taken into consideration when speaking about the interplay between actors in the EE (people, institutions) who reuse and recombine their “socioeconomic heritage” as measured by experience, network relationships, and social capital within EEs. This context helps one understand whether and how such human capital accelerators like universities can promote entrepreneurial activities and enrich EEs in transition.

The entrepreneurial patterns across transitional economies are quite different: The Global Entrepreneurship Monitor (GEM) shows lower levels of entrepreneurship in Russia compared to other transition economies. Russia compared to CCEs demonstrated an overall GEI underperformance by 1.8 times (Table 1) [Acs et al., 2018]. Such low values provide a strong indication that the current institutional environment hinders potential Russian entrepreneurs. Existing entrepreneurs are more often driven by necessity than by opportunity, the businesses either do not intend to grow or do not have the respective capacity and exhibit great distance from the world technological frontier. Operating on a large domestic market, entrepreneurs do not intend to enter the global market—which, in turn, is another reason for the low level of innovativeness.

One reason for the existing bottlenecks in Russia’s EE could be a distinct institutional environment, which is a mix of new institutions and actors, which emerged over the past 30 years, and the arrangement of older institutions (norms, values) inherited from the Soviet period. In particular, the structure, corporate culture and embeddedness of local universities in the emerging EE could explain different level of innovativeness of entrepreneurship and, thus, different outcomes of entrepreneurial development there.

This paper aims to describe the peculiarities of entrepreneurship relevant in post-socialist economies and its implications for the development of entrepreneurial ecosystems. We focus on Russia to understand the interplay between the (re)-emergence of entrepreneurship and the evolution of EE. We illustrate how the (re)emergence of entrepreneurship in the transition process affected the EE and its bottlenecks.

The EE Approach and Institutions

There are several definitions of the concept entrepreneurial ecosystems (see Table 2). The literature on EE is closely related to the discourse on innovation, including the early studies on innovation systems, the debate around territorial innovation milieus such as industrial districts, clusters, and technopoles; the triple helix model, and, more recently, the literature on entrepreneurial ecosystems [Zahra, Nambisan, 2012].

The EE approach adopts a multi-level perspective by stressing self-perpetuating mechanisms, close relationships, interdependencies, supporting effects, and forward and backward linkages among the elements. Furthermore, the EE approach clearly distinguishes between the entrepreneurial environment (ecosystem) and the entrepreneurial outcomes. Of the different kinds of entrepreneurial outcomes, the EE focuses on those opportunity recognition activities that are likely to result in ambitious start-ups with high growth potential. The performance of the EE is determined by the interplay of the entrepreneur, the organizations, and the institutions [Alvedalen, Boschma, 2017; Spigel, 2017; Stam, 2015] where the entrepreneur is the most important agent assuming his several roles (e.g., leader, mentor, and investor).

Generally, networks of different institutions are needed to trigger research development and innovation processes, with networking and cooperation supporting innovative activities at the regional level [Hewitt-Dundas, 2013]. There are three possible network configurations fostering regional entrepreneurial ecosystems, namely science-led, industry-led, and

---

1 In 2014, only 8.63% of Russian population between 18-64 years were entrepreneurially active, 50% or more below other (post-)transition economies: Hungary (16.93%), Romania (18.35%), Poland (15.99%), Lithuania (18.62%), Estonia (15.03%), Slovakia (18.20%), or even Kazakhstan (20.63%).

2 See the paper by Pager et al. in this issue.
policy-led (Table 3) [Diez, 2000; Schütz, 1999]. From this point of view, Russia represents a rather unique fourth case where the main driver of the local entrepreneurial ecosystem was a large business supported by the state to establish among other things a new university that could act as a hub attracting students and entrepreneurs to form an innovative environment (Skolkovovo) or by regional authorities (Innopolis in Tatarstan).

The EE approach stands in line with a larger vein of literature suggesting that regional differences in place-based conditions imply huge spatial variation of entrepreneurial activities [Acs, Storey, 2004; Acs et al., 2014; Fritsch, Storey, 2014; Sorenson, 2017]. The range of factors influencing entrepreneurship that are identified in this literature comprises agglomeration forces, industry structure, regional knowledge, and local entrepreneurship cultures and institutions. In large countries like Russia, the variety of these factors might be especially great [Chepurenko et al., 2017].

An important part of the regional knowledge stock is represented by universities which are therefore also a key actor of EEs. Universities of the third generation [Etzkowitz, 2001, 2003; Thursby, Thursby, 2002; Ulhau et al., 2012] might play an especially important role for the absorption, storage, and diffusion of knowledge and are also engaged in the generation of new knowledge within the triple helix model approach. First of all, they provide innovation-related inputs and contribute to the regional stock of human capital [Schubert, Kroll, 2016] that plays an important role in identifying entrepreneurial opportunities. Second, entrepreneurial universities as institutional players are key actors - brokers and gatekeepers - in local innovation systems [Fritsch et al., 2018; Graf, 2011; Kauffeld-Monz, Fritsch, 2013].

The EE approach is also rooted in the culture and institutional tradition [North, 1990] of entrepreneurial research. The key formal institutions that affect the supply and level of productive entrepreneurship are property rights enforcement, savings policies, taxation, and labor market regulation [Elert et al., 2017] as well as the structure and innovation potential of such local drivers as universities. An informal institution that determines the level of entrepreneurship is the extent to which entrepreneurship is socially accepted [Beugelsdijk, 2007; Mueller, Thomas, 2001; Smallbone, Welter, 2006]. An entrepreneurial culture is typically defined as the collective programming of the mind in favor of entrepreneurship [Beugelsdijk, 2007; Freytag, Thurik, 2007]. Our own research shows that entrepreneurial culture can be highly persistent over time [Fritsch, Wyrwich, 2014, 2017a; Stuetzer et al., 2018; Wyrwich, 2012] and differ even among different regions of the same country, such as West and East Germany [Fritsch et al., 2014; Wyrwich, 2013, 2015]. Institutions, which play an important role, might be structured differently. However, these differences are the result of a historical development or are path dependent.

The Institutional Context for Entrepreneurial Ecosystems in Post-Socialist Economies and Russia in Particular

Transition reforms in former planned economies have been believed to lead to better firm performance, resulting mainly from structural transformations, the support of market institutions, and openness to international trade and investment. The transition paths were not uniform across all countries undergoing the transformation. Empirical evidence indicates that the transition path of Russia and some other CIS countries was different from CEE countries.

It is widely accepted that the legacy effects of the socialist past determine entrepreneurship long after the start of the systemic transition [Estrin, Mickiewicz, 2011; Manolova et al., 2008; McMillan, Woodruff, 2002; Welter, 2005]. This is in line with the general literature on the distinctiveness of entrepreneurship in transition countries [Ovaska, Sobel, 2005; Smallbone, Welter, 2001; Welter, 2005].

However, over the course of the systemic transition itself, a set of country-specific factors and even institutional traps [Polierovich, 2017] occurred which predetermined a growing variety of post-transitional institutional settings in different transitional countries and regions [Aidis, Welter, 2008a, 2008b; Estrin, Mickiewicz, 2011; Welter, 2011]. Therefore, some authors argue in favor of a ‘diverging paths’ approach [Sauka, Chepurenko, 2017] differentiating the former socialist economies according to the inclusive vs. extractive institutions concept by Acemoglu and Robinson [Acemoglu, Robinson, 2012] as well as dominant types of entrepreneurial activity [Sauka, Welter, 2007].

Weaker institutions, path dependence, and vested interest groups have been argued to define the spe-
specific transition trajectory of Russia [Aidis et al., 2008; Bessonova, Gonchar, 2015; Bruton et al., 2010; Gurvich, 2016]. More specifically, institutional traps [Polterovich, 2017] which occurred as a result of the voucher privatization there [Boycko et al., 1995] led to a massive distortion of market signals and manifested itself in an exorbitant proportion of the state-owned enterprises (SOEs), a policy of industrial paternalism (e.g. soft budget constraints and a non-functioning creative destruction mechanism), which implies the unreasonable backing of inefficient industries and companies as well as an inefficient public administration mechanisms, weak property rights protection, the vulnerability of property, and an ongoing struggle for rents as the key institutional constraints [Gurvich, 2016]. This resulted in a dominant role of ‘predatory entrepreneurs’ [Feige, 1997] and of ‘unproductive entrepreneurship’ [Baumol, 1990] in the EE. A broad consensus in the literature exists that Russia’s current deficiencies in its entrepreneurial activity can be explained by institutional imperfections or obstacles, such as high borrowing costs, red-tape, high levels of corruption, insufficient rule of law, and issues with property rights [Chepurenko et al., 2017; Volchek et al., 2013; Yukhnaev et al., 2015; Zhuplev, Shtykhno, 2009].

In recent years, a continuous decline of Russian democratic institutions has been taking place [Lamberova, Sonin, 2018] and coincided with an all-encompassing trend of political and economic centralization [Alexeev, Mamedov, 2017], which probably also had an impact upon the emergence of regional EEs in a negative way.

Szerb and Trumbull [Szerb, Trumbull, 2018] analyze Russia’s EE over the period of 2006-2016 considering both its individual and institutional dimensions and conclude that the country lags significantly behind other transition as well as similar efficiency-driven economies. Informal investment, obsolete technologies, and low levels of internationalization as well as the lack of opportunity perception and startup skills within the population are among the factors still standing in the way of building a successful EE.

Although the literature shows a variety of EE on national, regional, and even global levels, the best studied are regional EEs, most of which are located in developed economies: Silicon Valley, Route 158, Boston, and Stanford clusters in the US, Aalto area near Helsinki, Finland, London Roundabout and the Thames Valley Business hub in Berkshire, England [Audretsch, Belitski, 2017], the Malopolskie region in Poland [OECD, 2019], and Skolkovo in Moscow. The favorable EE conditions of the region include a growing number of start-ups in the digital economy, accelerators, and venture capital funds as well as effective knowledge transfer centers (KTCs).

Using Estonian data, Velt et al. [Velt et al., 2018] identify seven key factors impacting the launch of global startups within a successful EE in transition economies: entrepreneurial talent, informal loans, bootstrapping, leadership, knowledge, engagement ser-

vices, and networks. For their growth, worker talent, formal equity (venture capital and angel investors), bootstrapping, professional services and intermediaries play an important role as well.\(^3\) Heller [Heller, 2013] attempts to evaluate the Russian innovation ecosystem and concludes that while there is some rapid development, for instance in infrastructure, the culture that was formed during the Soviet period remains the major drawback.

The current EE in Russia has shown shortages of coherent reforms of the R&D and innovation systems since the early 1990s [Gokhberg, 2004; Gokhberg, Kuznetsova, 2011], all of which results in a low level of innovation spillovers from universities. In some recent years, for instance, the Russian government and regional authorities tried to rebuild the regional EEs of Moscow, St. Petersburg, Tomsk, Tatarstan, and some other regions. The first nationwide cluster program was launched in 2012, with support for pilot innovative clusters being the first step [Kutsenko, Belitski et al., 2015; Heller, 2003; Powers, McDougall, 2005], and industrial parks in Russia has not delivered the desired results so far [Sosnovskikh, 2017].

Other elements in promoting regional EE include the technology parks, business incubators, technology transfer centers, prototyping and design centers, engineering centers, subsidized participation at fairs, and educational support. For instance, in his 2019 message to the Federal Assembly, President Putin announced that 15 scientific and educational centers, which are designed to integrate all levels of education and capabilities of scientific organizations and businesses at the regional level to boost technological development in Russian regions are supposed to be founded in the next three years. Three of these centers are to be launched already in 2019. However, all these attempts are typically top-down, both the role and motivation of industry and universities to participate are still scarcely researched.

Therefore, in the following section we would like to describe the role of the higher education institutions in Russia as prospective core elements of regional EEs and the historically rooted institutional constraints.

**Russian Universities as Actors in EEs**

A modern strand of an entrepreneurial research defines entrepreneurial universities, around which the EEs evolve, as key elements in promoting regional economic growth [Fuster et al., 2019; Guerrero et al., 2016]. Accompanying this development, spin-off entrepreneurship, patenting, licensing and other activities of knowledge and technology transfer from universities to the private sector have attracted considerable scholarly attention [Astebro, Bazzazian, 2011; Gianiodis et al., 2016; Meissner, Shmatko, 2017; Perkmann et al., 2013; Rothaermel et al., 2007]. An important part of this literature has sought to explain the institutional differences in technology transfer [Bijedic et al., 2015; Bruneel et al., 2010; Grime, Fier, 2010; Leydenm, Link, 2013]. For example, it has been found that the level of industry funding and the nature of research within the university [O’Shea et al., 2005; Powers, McDougall, 2005], the size and quality of the research faculty [Di Gregorio, Shane, 2003; O’Shea et al., 2005], and a university’s entrepreneurial tradition [D’Este, Perkmann, 2011; Lockett et al., 2005; Shane, 2004] all are strong predictors of the probability and number of spin-off companies.

Moreover, as it is shown in the literature, a significant share of knowledge flows related to the creation and commercialization of novel ideas occurs in geographically limited areas [Audretsch, 2003; Hassink, Wood, 1998; Keeble et al., 1998]. Our own research in this realm shows that knowledge spillovers within universities, but also into the region, are conduite for entrepreneurship [Fritsch, Wyrwich, 2017b; Goethner, Wyrwich, 2017]. This finding is in line with the knowledge spillover theory of entrepreneurship (e.g., [Carlsson et al., 2009]). That is knowledge generated within universities and commercialized via the establishment of entrepreneurial firms.

The empirical research on the position of universities and their prominent role [Korosteleva, Belitski, 2017] within entrepreneurial ecosystems in transitional economies has been rather scarce so far. Although some CEE regions are already successful in implementing an entrepreneurial university – a few examples include Entrepreneurship Home® and IdeaLab at the University of Tartu as well as Mectory at the Tallinn University of Technology (both in Estonia) or the Startup Campus at the Technological University of Budapest (in Hungary) – a truly working knowledge transfer through entrepreneurial universities seems to be a general bottleneck of EEs there. The patterns of research commercialization in transition economies (Azerbaijan, Belarus and Kazakhstan) are somewhat different from established market economies: the existence of technology transfer offices and other institutions does not correlate with research commercialization, contrary to the direct industrial funding of university research [Belitski et al., 2019]. This might be caused by institutional inertia (traditionally, the higher education structure and objectives in the former USSR were different than in the West) as well by some institutional arrangements which occurred already during the systemic transition.

First of all, it is the scope and quality of research at Russian universities. Since the beginning of the in-

---

\(^3\) See also Trabskaja and Mets in the current issue.
dustrialization policy under Stalin, there has been a strong differentiation between higher schools as institutions to enable the mass education of engineers for huge Soviet plants and construction projects, and research institutes of the Academy of Sciences where highly qualified researchers worked. R&D activities at the universities were restricted, an institutional separation of higher education from research persisted over the decades [Froumin et al., 2014; Smolentseva et al., 2018]. Only exceptionally, the oldest centers like St. Petersburg and Moscow State universities obtained a more or less developed research infrastructure. In early 1960s, the newly established Novosibirsk State University joined this small group of researching universities. Besides, there were some technical universities (Bauman higher technical school⁴, Moscow Physical-Technical higher school, etc.) where applied research was an obligatory part of education. In recent years, the aforementioned Program 5–100 of the Russian government⁵, partly supported the establishment of research and education clusters of excellence at about 25 universities, but it hardly changed the general situation among the approximately 1,150 other higher schools and universities. Taking into consideration the historical origins and the current context, most of the higher schools are simply not able to become triggers for regional EEs due to a lack of pioneering research units and qualified personal [Froumin et al., 2014; Gershman et al., 2018].

Second, it is the role of the historically overcentralized location of the leading research and education institutions. In the Russian Empire in the beginning of the 20th century, there were only 12 universities, three of them on the territory of modern Ukraine, and one each in Estonia, Lithuania, Finland, and Poland. In Russia itself, there were only five universities – in St. Petersburg, Moscow, Kazan, Tomsk, and Saratov. This means that most of Russian regions had no established centers of research and education. Even now, about 30% of all Russian universities are located in the two capitals (approximately 270 in Moscow and another 90 or so in St. Petersburg). The majority of research institutes of the Russian Academy of Sciences and many EE infrastructure units (industrial parks, business incubators, engineering and prototyping centers etc.) are concentrated in Moscow and St Petersburg [Sivak, Yudkevich, 2017]. There, the partly overlapping networks of several universities, research institutes, and industrial enterprises form a synergetic effect and, thus, a dense regional EE. Outside of these capital cities, there are only a few ‘research cities’ (like Kazan, Tomsk, Tyumen, Novosibirsk, and so on.) where first-class universities and other institutions might form the core of a local EE [Aldieri et al., 2018].

After the collapse of the Soviet Union, universities in Russia were caught in a situation of high uncertainty and a lack of funding. Due to large problems with the higher education system during the 1990-2000s, the research equipment and education infrastructure even at the most advanced Russian universities were often old or outdated. Some of them try to avoid these constraints by focusing on promoting and funding a few centers of excellence, but under the current trend of the general reduction of state funding for education in the country and a lack of private donators who could fill in the financial gap, the innovation potential of most of Russian universities remains rather restricted [Gokhberg, Kaznetsova, 2011]. Ever since this transformation process started, fostering research commercialization became one of the priority issues for policymakers and the public authorities. Starting in the mid-2000s, some measures directed at underpinning the role of higher education institutions (HEI) within the EE were implemented in Russia [Gokhberg, 2004]. Federal and National Research Universities were established, innovative education programs (IEPs) were launched, and the so-called Program 5–100, which intended the inclusion of at least five Russian universities in international rankings, was launched in 2013. These measures were intended to strengthen the national innovation system [Gokhberg, Kaznetsova, 2011] and the position of the universities within EEs.

Third, the corporate culture of Russian universities, partly inherited from the past, partly established during the transition itself [Yudkevich, 2014], is another obstacle to impeding the transformation of them into crucial actors in regional EEs. It is known from the literature that to become a driver of the local EE, the university should transform into a third generation or entrepreneurial university [Astebro, Bazzazian, 2011; Clark, 1998; Gianiodis et al., 2016; Meissner, 2018]. Unfortunately, most Russian higher schools and universities do not feel inspired to transform the organizational structure, corporate spirit, personal renewal, and so on. [Froumin et al., 2014].

Finally, important stakeholders of entrepreneurship at universities are students, both in form of an on-site-campus entrepreneurship and in form of an IT-startup activity, which play an important role in the development of regional entrepreneurship ecosystems, but also need to be supported by the latter during the initial stage. The entrepreneurial engagement of students in Russia (and some other CIS countries) is rather high: the proportion of potential entrepre-

---

⁴ Current name is the Bauman Moscow State Technical University (BMSTU).
⁵ Program 5-100 is aimed at promoting a small group of universities to place in the top 100 universities in the world in their area of expertise.
neurs (i.e., those who already try to start their own business) among students is 27%, which is 6 percentage points higher than in the international sample, and the share of active entrepreneurs (i.e., those who already manage their own business) is up to 8%. Compared to 2011, the number of potential entrepreneurs among Russian students increased by 5 percentage points [Bergmann, Golla, 2016]. These data do not reflect the character of the entrepreneurial activity of students (opportunity vs. necessity driven; innovative or rather on campus business activities etc.) but says much about the entrepreneurial spirit of young prospective entrepreneurs.

However, the engagement of the teaching staff of universities in entrepreneurial activity is very moderate. One of the reasons is the median age of universities' fellows. As a result of the degradation of science and education in early 1990s, younger cohorts left Russian universities and either moved to the commercial sector, public administration, or settled in the West [Korobkov, Zayonchkovskaya, 2012], therefore the age structure of a typical Russian university is dominated by older cohorts raised under the Soviet system who are not inclined to commercialize their research outputs.

One of the tools to establish an innovative entrepreneurial community within the universities was the governmental plan to enable educational institutions and their fellows to establish new small innovative ventures according to the Federal Law Nr. 217 adopted in 2009. Innovators received taxation preferences and universities received 33% of companies' stock capital, as well as the right to the intellectual property of start-ups. However, the initial enthusiasm soon declined. To compare, in 2010-2011 in Russia more than 1,300 small innovative enterprises (SIE) were established, in 2012-2013 – only about 1,000, in 2014-2015 slightly more than 350, while in 2016-2018 this figure was also about 350, but within a three-year period. There were several typical problems that occurred and showed that the innovative potential of Russian universities to become triggers of regional EEs was very limited. First, it came out that it was an extremely complicated problem to identify the intellectual property as a contribution to share capital of the SIE. Second, universities' fellows were not ready to take responsibility for creating SIEs as founders or act as managers. Third, due to bureaucratic reasons, universities could not provide them rent for free – most of the SIEs would rent rooms outside of the universities. Lastly, the rather few private business angels and venture capitalists were prepared to deal with start-ups led by novice entrepreneurs and supported by inexperienced innovation infrastructure officers of the universities. Thus, the entrepreneurial enthusiasm of students is not linked with the commercialization of know-how of teaching staff at most Russian universities.

Some additional reasons for this phenomenon are also evident: the primitive structure of the national economy does not support any demand for innovative start-ups, while high risks, weak or absent financial and legal support infrastructure, and a low level of horizontal networking between universities and industry in regional EEs [Bruneel et al., 2010; D’Este, Perkmann, 2011] shape additional constraints for academics and students motivated to create a commercial spin-off of their know-how.

Conclusions and Implications

Due to historical reasons and the transition experience, regional EEs in Russia are characterized by a weak institutional frame, the marginal role of innovations, a lack of horizontal cooperation between key stakeholders, and the restricted influence of universities upon regional EEs.

Although Russia has a high level of overall education and students' willingness to become entrepreneurs is rather high, a stronger embeddedness of universities into the EEs is required. To achieve this goal, in recent years the Russian government launched several initiatives to support the emergence of a group of world class universities and to promote entrepreneurship in academia. However, there are two groups of factors which are lowering the ability of higher education institutions to become important actors in regional EEs – first of all, this includes the rigid institutional framework (the low level of pioneering research activities, the weakness of an innovation support infrastructure within and on the periphery of the university, the lack of an entrepreneurial mindset among professors, etc.) and second, the unfavorable macro conditions (the low innovation absorption capability of the economy, the dominance of the state-owned large corporations on the domestic market, insecure property rights, and so on).

To support this positive trend, entrepreneurial research should focus on investigating cases of success of single university-led regional EEs in Russia and other CIS countries – to learn which strategies could be benchmarked and widespread. Moreover, a comparison of Russia with the CEE and other CIS countries would be of particular interest, as any entrepreneurial policy needs to be tailor-made to the specific regional and country-specific conditions. This includes the acceptance of the historical roots of these conditions which are similar in these countries. Thus, further research could, for instance, deal with the hist-

torically evolved role of the Russian government with respect to scientific organizations and knowledge transfer [Gershman et al., 2018] to better understand some present-day bottlenecks of Russian regions' EEs.

In order to build a sustainable EE in Russia, the fostering of synergies between the EE actors, among them the university-business collaboration, is needed. The bridging role of alumni and practitioners as business angels and coaches should be supported. For this reason, tax reductions for business angels and private venture funds, including international ones, should be implemented. This could also strengthen the weak internationalization pillar of Russian EEs.

Another measure could be strengthening entrepreneurial education at universities. Further elements of the overall university strategy might be increasing the number of chairs in entrepreneurship, business incubators, and engineering and prototyping centers as well as attracting business representatives who would coach and mentor start-ups and promote entrepreneurial culture to help universities establish an EE from the bottom-up.
